Release Planning Meeting

January 23rd, 2024

3:00pm to 4:30pm

Attendance

Matthew Berger, Harman Barpaga, Hamza Chaudhry, Duncan McDonald, Matty Slyzys, Michael Conroy, Azeel Jivraj

Find a tool to manage user-stories

The team has set up a board on Jira to record and track user stories while the project is ongoing. The Jira has been shared with all members, the professor, and TA.

Requirements of System

It was agreed upon that all requirements that we think we need for the system are to be added to the release planning document before submission due date. Team members should also add any user stories they think are needed to the Jira.

In order to expand on the requirements of the system, a travel integration feature was suggested and is planned as a large component of the software. This will include features such as an hourly forecast for a planned travel route or daily travel schedule. In addition to the weather API, we will now include a map API for the travel features.

Other requirements that were suggested are weather tracking for popular areas, shared notifications for family members, emergency contact notifications, forecast changes, schedule adaptation, customizable widgets, adaptive and customizable colour schemes, and others that are in the release planning document.

A wireframe of the app was to be made to preview the home page of the app.
